

COURSE FEEDBACK APP

Final Project Demo

Course feedback collection with automatic results export

An application for entering course feedback, viewing saved responses, calculating the average rating, and exporting the results to a CSV file.

The screenshot displays the 'Course Feedback App' window. It features a light gray sidebar on the left with labels for 'Course Name:', 'Rating:', and 'Comment:'. The main area on the right contains a text input field for the course name, a rating spinner set to '1', and a text area for the comment. Below these are two blue buttons: 'Add Feedback' and 'Show Average Rating'. At the bottom left is an 'Export to CSV' button. The bottom right section displays the following feedback summary:

Course: System Implementation
Rating: 5/5
Comment: This course was good

What I will show in the live demo

The presentation is short so most of the time can be spent showing the working app.

Main goal

Show that the app is easy to use and also does automatic work for the user, especially the average calculation and CSV export.

Demo focus

Instead of showing login or extra setup, the demo focuses on the working feedback workflow from input to export.

Technical focus

The app uses a GUI, lists for stored entries, input checks, file writing, and a simple testing plan.

Why this app is useful

- Course feedback can be messy when it is collected by hand.
- Ratings and comments are easier to review when they are stored together.
- The app is simple enough for students, instructors, or small class projects.

The screenshot shows a web application titled "Course Feedback App". It features a form with the following fields: "Course Name:" (a text input), "Rating:" (a dropdown menu currently showing "1"), and "Comment:" (a text area). Below the form are two buttons: "Add Feedback" and "Show Average Rating". At the bottom, there is an "Export to CSV" button and a summary box displaying "Course: System Implementation", "Rating: 5/5", and "Comment: This course was good".

Who it is for

Students giving feedback
Instructors reviewing feedback
Small class or training projects

What problem it solves

It replaces scattered manual notes with one simple screen for entering and reviewing feedback.

What makes it simple

Only the main features are included: add, view, average, and export.

Features shown in the final version

1 Add feedback

The user enters a course name, selects a rating, and writes a comment.

2 View feedback

The app displays submitted feedback in the output area.

3 Show average

The app automatically calculates the average of all ratings.

4 Export results

The app creates a CSV file that can be opened in Excel.

The screenshot shows a web application window titled "Course Feedback App". It features a form with three input fields: "Course Name:" (a text input), "Rating:" (a dropdown menu currently showing "1"), and "Comment:" (a text area). Below these fields are three buttons: "Add Feedback", "Show Average Rating", and "Export to CSV". The "Add Feedback" button is highlighted with a blue gradient. Below the buttons is a large, empty light gray rectangular area intended for displaying feedback entries.

Feedback entry saved in the app

What the system does automatically

Automatic calculation

The app adds ratings together and calculates the average rating without the user doing math manually.

Automatic organization

Feedback entries are stored in lists and displayed in a consistent format after submission.

Automatic export

The app writes course names, ratings, and comments into a CSV file for reporting.

Testing plan

- Test valid feedback entries.
- Test missing course names or comments.
- Check that the average rating is correct.
- Open the exported CSV file to confirm the data.

Error handling

- Shows a message when required fields are blank.
- Prevents exporting when no feedback exists.
- Uses a file error message if the CSV cannot be created.

Final project goal

A clean and working Course Feedback App that collects feedback, shows saved entries, calculates an average rating, and exports results.

Completed

- GUI form
- Feedback storage
- Average rating
- CSV export
- Basic validation

- No login
- No database
- No advanced roles
- No complicated setup
